

# Functional requirements

---

## General

1. The whole UI will be written in **Slovak**.
2. The system will offer a processing of the multiple **.xml** files from a **chosen directory** in one execution of the program.

## Extracting data

1. The system will extract relevant project data from a file **šišan.xml**.

## Form

1. The system will offer a possibility to fill out a form in a **GUI** for obtaining statement from **electrical connection technician**.
2. The system will support single and multiple choice questions in the form.
3. The system will offer traversing the form via buttons **Previous** and **Next** (or maybe better said their localized variants **Predošlá otázka** and **Nasledujúca otázka**)
4. The system will show at the end of the form the **summary** of technician's answers.
5. The chosen answers will be written into the second part of the resulted binding statement (see **Output 1.**).

## Output

1. The system will create **{Project.id} - DPO ({timestamp}).docx** (generated DPO binding statement) based on the template **VZOR - Záväzné vyjadrenie DPO.docx** from a hoarded data (**.xml** file + form if it was not skipped).
2. The system will **log** execution of the program to **log\_{success}\_{time\_stamp}.txt** file indicating **success** / **fail** of the program.

## Sending as a attachment

1. The technician will have a possibility to send generated statement via mail as a attachment to his **supervisor** for a **review**. This requirement has a low priority - perhaps in the later stage of the project.

# Nonfunctional requirements

---

1. Logic of the app will be implemented in **Python**.
2. GUI will be implemented using **Qt for Python** framework.
3. The whole process of extracting data and creating the final statement (excluding interaction with a user) should take less than 1 sec.
